# Chapter 1. Getting Started

## Introduction

The **Library Integration toolkit** provides you with the ability to create Pulsonix library (Schematic Symbol, PCB Footprint and Part) items from your own data sources. This might include, for example, importing data from another CAD system, or generating footprints from information retrieved from the Internet.

The files are of a fixed ASCII format as defined in this specification and are imported using a licensed interface mechanism.

## The contents of the Toolkit

The Toolkit consists of:

- This documentation (the import file specification).
- Importers to read library integration files.

## Licensing the Toolkit

The license for this option is shown in the **License Manager** dialog as **Library Integration Toolkit**. There is no charge for this option.

In addition, creation of **bond pads** and **wires** in footprints is controlled by the availability of another license, which appears in the **License Manager** dialog as **Chip Packaging Toolkit**. Without this license, bond pad and wire commands will be ignored.

## Creating library Integration files

The commands available for use in a library integration file generally follow the 'controls' presented on the pages of the corresponding **Pulsonix Library Wizard**, and the resulting library items should correspond to those that can be generated using the same values in the wizard.

Integration files are processed sequentially (from start to finish), and – except for the **FORMAT command** - any of the commands listed in the reference sections may appear anywhere in the file. However, for ease of understanding the commands are separated into those that generally only appear at the start of the file and those that are used to generate the actual footprints.

The positioning and ordering of commands in the file is not generally critical. Any side-effects for particular commands are mentioned in the description for those commands.

Each line of a integration file contains a keyword, followed by one or more parameters (depending on the keyword), separated from each other by commas. Blank lines, and

any lines starting with semi-colon, are ignored. Text (e.g. name) fields may be enclosed in double quotes if desired.

Some commands are applicable only in certain contexts, for example only for certain footprint types. The toolkit does not context-check the commands, so specifying commands that are not applicable may either have no effect, or cause unpredictable results. If commands are specified as they would be entered interactively through the corresponding Wizard, then this should give the desired result. The same applies to range checking, for example on the number of pads on a footprint.

### Using library integration files

Library integration files are loaded into Pulsonix through the **Import** option on the relevant page of the **Libraries** dialog.

For example, to import a footprint integration file, open the **Libraries** dialog and go to the **Footprints** tab. Choose the library to which the generated footprints should be written. Click the **Import** button, browse to the desired integration file, and click on **Open**. The file will be loaded and processed to generate the specified footprints.

## Chapter 2. Symbol Files

### General commands

# Text\_here

The hash (#) character can be used at the start of any new line to write a comment. It should be added to every line which needs a comment. It can be used at any point in the SGF file. Comments can also be made using the semi-colon character ; at the start of a line.

EXIT

The EXIT command can be placed anywhere in the format file to stop the import of the file. You may wish to use the command during a multi-item import to debug the items above it or to restrict import to a particular number of items.

### Header section commands

FORMAT,SGF,1

The first line of the file should contain this command, which specifies that this is a symbol library toolkit file, and also gives the format version number (currently version 1).

FILE,filename

Include another integration file. Each line in the specified file is processed, then processing of the current file resumes.

TYPE,symbol\_type

Specify the type of symbol to create. These values correspond to those available interactively through the Symbol Wizard.

symbol\_type := RECT | SEG | TRI

UNITS,unit,factor,precision

Co-ordinate units.

unit :=	0	inch
	1	thou
	2	metre
	3	millimetre
	4	micron
	5	centimetre

factor := units per base units, generally always 1

precision := number of decimal places

### Symbol section commands

The commands listed here are divided into several sections. Many commands (listed under ‘Generic commands’) are applicable to many or all symbol types, whilst others only really apply to particular types.

## 10 Symbol Files

---

### Generic commands

NAME,symbol_name	The name by which the symbol is to be known. This command is the one that triggers generation of the symbol and writing it to the library, so positioning of this command in the file is critical to achieving the desired symbols.	
BOTTOMPINDIRLEFT,bool	True if the pins on the bottom side are numbered leftwards.	
BOTTOMPINORDER,int	The 'side order' for numbering pins on the bottom side of the symbol.	
BOTTOMPINS,count	The number of pins on the bottom side.	
CLKPIN,size	The size of the clock pin marker.	
INVPIN,size	The size of the inverted (not) pin marker.	
LEFTPINDIRUP,bool	True if the pins on the left side are numbered upwards.	
LEFTPINORDER,int	The 'side order' for numbering pins on the left side of the symbol.	
LEFTPINS,count	The number of pins on the left side.	
LEGLEN,size	The length of the terminal "legs".	
LINESTYLE,name	The name of the line style to use for creating shapes.	
LINEWIDTH,size	The thickness of the style used for creating shapes.	
MARKPIN,pin_number[,type][,CLK]	Adds 'special' marker(s) to specified pin. The available types correspond to those available interactively in the Symbol Wizard. Including the optional field "CLK" will also include a Clock pin marker inside the symbol outline.	
pin_number	pin (terminal) number	
type	POLIN   POLOUT   INV	
NAMEPOS,name_pos	Specify the position for the component name.	
name_pos	0	bottom left
	1	bottom right
	2	top right
	3	top left
	4	centre

---

NUMBERSOUTSIDE,bool  
Whether or not pin numbers should be placed ‘outside’ the pins, away from the body of the symbol.

ORIGIN,origin\_pos  
The position of the footprint (symbol) origin.

origin_pos	0	centre
	1	pin 1

PADDIM3,size  
The size of the third size parameter required for some pad style shapes. This is the thickness for target or cross, the inner size for annulus, and the corner radius for rounded rectangle.

PADFILLED,bool.  
Specify whether the pad style for terminals is to be ‘filled’.

PADLENGTH,size  
The length for some pad style shapes (rectangle, rounded rectangle, triangle, oval, bullet, pointer, diamond).

PADPITCH,size  
The size of the step between adjacent pads.

PADSHAPE,pad\_shape  
The shape of the pads. Note that presently only some of the possible pad shapes are supported by the toolkit.  
pad\_shape := DIAMOND | OVAL | RECT | ROUND | ROUNDRECT | SQUARE | CROSS | CHAMFERRECT | BULLET | TRIANGLE | PLUS

PADSIZE,size  
The width of pads.

PADSTYLE,style\_name  
The name to use for the pad style.

PARTNAMEPOS,name\_pos  
Specify the position for the Part name. Values are the same as for the NAMEPOS command.

POLPIN,size  
The size of the polarity in/out pin marker.

RIGHTPINDIRUP,bool  
True if the pins on the right side are numbered upwards.

RIGHTPINORDER,int  
The ‘side order’ for numbering pins on the right side of the symbol.

RIGHTPINS,count  
The number of pins on the right side.

SHOWLOGICNAMES,bool  
Whether or not to set logic names to be visible.

## 12 Symbol Files

---

SHOWPINNAMES,bool

Whether or not to set pin names to be visible.

SPICENAMEPOS,name\_pos

Specify the position for the Spice model name. Values are the same as for the NAMEPOS command.

SYMWIDTH,size

The width of the symbol outline (“body”).

TOPPINDIRLEFT,bool

True if the pins on the top side are numbered leftwards.

TOPPINORDER,int

The ‘side order’ for numbering pins on the top side of the symbol.

TOPPINS,count

The number of pins on the top side.

### Segmented Rectangle symbols

SEGMENTS,count

Number of segments.

SEGLEFTPINS,count

Number of pins on the left of each segment.

SEGRIGHTPINS,count

Number of pins on the right of each segment.

## Chapter 3. Footprint Files

### General commands

# Text\_here

The hash (#) character can be used at the start of any new line to write a comment. It should be added to every line which needs a comment. It can be used at any point in the FGF file. Comments can also be made using the semi-colon character ; at the start of a line.

EXIT

The EXIT command can be placed anywhere in the format file to stop the import of the file. You may wish to use the command during a multi-item import to debug the items above it or to restrict import to a particular number of items.

### Header section commands

FORMAT,FGF,1

The first line of the file should contain this command, which specifies that this is a footprint library toolkit file, and also gives the format version number (currently version 1).

TYPE,footprint\_type

Specify the type of footprint to create.

footprint\_type := AXIAL | DIP | PGA | QUAD | RADIAL

UNITS,unit,factor,precision

Co-ordinate units.

unit :=	0	inch
	1	thou
	2	metre
	3	millimetre
	4	micron
	5	centimetre

factor := units per base units, generally always 1

precision := number of decimal places

FILE,filename

Include another footprint integration file. Each line in the specified file is processed, then processing of the current file resumes.

### Footprint section commands

The commands listed here are divided into several sections. Many commands (listed under ‘Generic commands’) are applicable to many or all footprint types, whilst others only really apply to particular types.

## 14 Footprint Files

---

### Generic commands

#### ADDBONDPAD,x,y,angle

Add a bond pad in a particular position. This command allows you to create bond pads and wires. The co-ordinates supplied are relative to the position of the symbol origin. Each bond pad created (using the bond pad style, see BONDPAD\* commands) will be wired to the corresponding normal (die) pad using the specified wire style (see WIRE\* commands).

---

*Note: This list of bond pads is only applied to the current footprint; the list is deleted as soon as the current footprint has been generated.*

---

#### ADDBONDPADREL,dx,dy,angle

Add a bond pad in a particular position relative to the previous bond pad added.

#### ADDBONDPADSET,count,sx,sy,dx,dy,angle

Add a number of bond pads in specified positions, the equivalent of repeated calls to ADDBONDPAD command.

count := how many bond pads to add  
sx,sy := co-ordinates of first bond pad  
dx,dy := delta "step" between each pad in x & y  
angle := pad angle

#### ADDBONDPADSETREL,count,dx,dy,angle

Add a number of bond pads in specified positions relative to the previous bond pad added, the equivalent of repeated calls to ADDBONDPADREL command.

count := how many bond pads to add  
dx,dy := delta "step" between each pad in x & y  
angle := pad angle

#### ADDPAD,x,y

Add a pad in a particular position. This command allows you to specify pad positioning that the footprint integration would not normally create. The co-ordinates supplied are relative to the position of the symbol origin.

---

*Note: This list of 'irregular' pads is used in place of (not as well as) the default pads for the footprint type. Also, it is only applied to the current footprint; the list is deleted as soon as the current footprint has been generated.*

---

#### ADDPADREL,dx,dy

Add a pad in a particular position relative to the previous pad added.

#### ADDPADSET,count,sx,sy,dx,dy

Add a number of pads in specified positions, the equivalent of repeated calls to ADDPAD command.

count := how many pads to add  
sx,sy := co-ordinates of first pad  
dx,dy := delta "step" between each pad in x & y

#### ADDPADSETREL,count,dx,dy

Add a number of pads in specified positions relative to the previous pad added, the equivalent of repeated calls to ADDPADREL command.

count := how many pads to add  
 dx,dy := delta “step” between each pad in x & y

BONDPADDRILL,size  
 Bond pad drill diameter.

BONDPADLAYER,layer\_name  
 Specify the name of the layer on which bond pads should be created. The value for this field is generally one of:  
 <Through Board>  
 <Top Side>  
 <Bottom Side>

BONDPADLENGTH,size  
 The length for some pad style shapes (rectangle, rounded rectangle, triangle, oval, bullet, pointer, diamond).

BONDPADSHAPE,pad\_shape  
 The shape of the bond pads. Note that presently only some of the possible pad shapes are supported by the toolkit.  
 pad\_shape := DIAMOND | OVAL | RECT | ROUND | ROUNDRECT | SQUARE | CROSS | CHAMFERRECT | BULLET | TRIANGLE | PLUS

BONDPADSIZE,size  
 The width of bond pads.

BONDPADSTYLE,style\_name  
 The name to use for the bond pad style.

DRILL,size  
 Pad drill diameter.

FIRSTPIN,pin\_num\_pos  
 Specify the position for the first pin number.

pin_num_pos :=	0	bottom left
	1	bottom middle
	2	bottom right
	3	right bottom
	4	right middle
	5	right top
	6	top right
	7	top middle
	8	top left
	9	left top
	10	left middle
	11	left bottom

NAME,footprint\_name  
 The name by which the footprint is to be known. This command is the one that triggers generation of the footprint and writing it to the library, so positioning of this command in the file is critical to achieving the desired footprints.

NAMEPOS,name\_pos

Specify the position for the component name.

name_pos	0	bottom left
	1	bottom right
	2	top right
	3	top left
	4	centre

ORIGIN,origin\_pos

The position of the footprint (symbol) origin.

origin_pos	0	centre
	1	pin 1

PADCOUNT,count

The number of pads in the footprint.

PADDIM3,size

The size of the third size parameter required for some pad style shapes. This is the thickness for target, the inner size for annulus, and the corner radius for rounded rectangle.

PADLAYER,layer\_name

Specify the name of the layer on which pads should be created. The value for this field is generally one of:

<Through Board>  
<Top Side>  
<Bottom Side>

unless creating die pads for die/bond wiring, in which case this should specify the appropriate wire layer name from your technology file (e.g. Wires Top).

PADLENGTH,size

The length for some pad style shapes (rectangle, rounded rectangle, triangle, oval, bullet, pointer, diamond).

PADPITCH,size

The size of the step between adjacent pads.

PADSHAPE,pad\_shape

The shape of the pads. Note that presently only some of the possible pad shapes are supported by the toolkit.

pad\_shape := DIAMOND | OVAL | RECT | ROUND | ROUNDRECT |  
SQUARE | CROSS | CHAMFERRECT | BULLET | TRIANGLE | PLUS

PAD1SHAPE,bool,pad\_shape

If true, the first pad on the footprint is created using the specified pad shape. Otherwise, all pads are created using the same basic pad shape.

PADPLATED,bool

Whether or not to set the pad style as Plated.

PADSIZE,size

The width of pads.

PADSTYLE,style\_name

The name to use for the pad style.

PINORDER,pin\_order

The order in which pins should be numbered.

pin_order	0	clockwise
	1	counter-clockwise

PLACEBOX,llx,lly,urx,ury

Specify the location of the enclosing box of the placement shape. This box is discarded after each footprint is generated. The co-ordinates supplied are relative to the position of the symbol origin.

PLACECREATE,bool

Whether or not to generate a placement shape.

PLACEGAP,size

The gap between the pad edges and the placement shape.

PLACEISAREA,bool

Whether or not the placement shape is to be created as an Area.

PLACELAYER,layer\_name

The name of the layer on which the placement shape is to be added.

RENAMESYMBOL, oldname , newname

Renames the specified existing symbol to a new name.

**IMPORTANT:** this command acts directly on the currently selected library.

Also, as this command can remove symbols from your library without asking for confirmation, it is recommended that you take a backup copy of your library first just in case the results are not what you expect.

ROWPITCH,size

The distance between rows of pads. The precise effect of this command depends on the type of footprint being generated.

---

*Note: Setting this value also sets the VERTROWPITCH parameter to this size. To specify horizontal and vertical row pitches separately, the HORIZROWPITCH and VERTROWPITCH commands should be used.*

---

SHOWPINNAMES,bool

Whether or not to set pin names to be visible.

SILKCREATE,bool

Whether or not a silkscreen shape should be created.

SILKDOT,bool

Whether or not to add a 'dot' at pad 1 on the silkscreen.

SILKGAP,size

The gap between the pad edges and the silkscreen shape.

SILKLAYER,layer\_name

The name of the layer on which the silkscreen shape should be created.

## 18 Footprint Files

---

- SILKMITRE,bool  
Whether or not the first corner of the silkscreen shape should be mitred.
- SILKMITRESIZE,size  
The size of the silkscreen corner mitre.
- SILKNOTCH,bool  
Whether or not the end of the silkscreen shape should be mitred.
- SILKNOTCHSIZE,size  
The size of the silkscreen notch.
- SILKOUTSIDE,bool  
Indicates whether the silkscreen shape is outside the pads or inside.
- WIRELAYER,layer\_name  
The name of the layer on which bond wires should be created.
- WIRESIZE,size  
The size of the line style used for bond wires.
- WIRESTYLE,style-name  
The name of the line style for bond wires.

### Axial footprints

- AXIALLEGS,bool  
Specify whether or not 'legs' are to be drawn between the component outline 'box' and the pads.
- BOXLENGTH,x  
Horizontal length of component outline box.
- BOXROUND,bool  
If true, the component outline will have semi-circular ends instead of flat.
- BOXWIDTH,y  
Vertical size of component outline box.

### PGA footprints

- COLCOUNT,count  
The number of columns.
- ROWCOUNT,count  
The number of rows.
- STAGGERODD,bool  
Whether or not odd rows of the footprint are 'staggered'.
- STAGGERPITCH,size  
The amount by which alternate rows of the footprint are staggered.

## QUAD footprints

HORIZPADCOUNT,count

The number of pads along the horizontal sides.

HORIZROWPITCH,size

The distance between the rows of pads on horizontal sides of the footprint.

VERTPADCOUNT,count

The number of pads along the vertical sides.

VERTROWPITCH,size

The distance between the rows of pads on vertical sides of the footprint.

## RADIAL footprints

DIAMETER,size

The radius of the component outline shape.

RADIUS,size

The radius of the component outline shape. This command is provided as an alternative to the DIAMETER command; both commands affect the same underlying value.

STARTANGLE,angle

The angle at which the first pin is positioned relative to the centre of the footprint.

TABANGLE,angle

The angle of the 'tab' on the silkscreen shape.

TABSIZE,size

The size of the 'tab' on the silkscreen shape.

## Standard parameter types

angle

Angle as a floating-point number.

bool

Boolean true/false value. Specify Y or y for true, any other value for false.

count

Number of items as a positive integer, generally greater than zero.

size

Item size, width or diameter in current units.

x

X-coordinate in current units.

y

Y-coordinate in current units.

## Chapter 4. Part Files

### General commands

# Text\_here

The hash (#) character can be used at the start of any new line to write a comment. It should be added to every line which needs a comment. It can be used at any point in the PGF file. Comments can also be made using the semi-colon character ; at the start of a line.

EXIT

The EXIT command can be placed anywhere in the format file to stop the import of the file. You may wish to use the command during a multi-item import to debug the items above it or to restrict import to a particular number of items.

### Header section commands

FORMAT,PGF,3

The first line of the file should contain this command, which specifies that this is a part library toolkit file, and also gives the format version number.

The current version number is version 3.

**IMPORTANT:** for format 3 and later, new parts will default to being added together into the same group as they are created. To prevent this, either use format 2, or add the command PARTGROUP,NONE near the start of the file.

FILE,filename

Include another integration file. Each line in the specified file is processed, then processing of the current file resumes.

### Part section commands

Finding or creating Parts

ASSOCPART,name[,desc[,family[,namestem]]]

Generate a new Associated part using the supplied parameters.

name :=	part name
desc :=	optional part description
family:=	optional part family

FINDPART,name

Find and open an existing part using the supplied name. This is now available for edit (adding attributes to for example).

name :=	part name
---------	-----------

**NEWPART**,name,desc,mfr,scmsym,[scmsympin],footprint,num\_pins[,pin\_num\_list]  
Generate a new part using the supplied parameters.

If specifying pin number entries for ‘multiply mapped’ pins, the entry should be enclosed in double-quotes, for example: 1,2,3,”4,5,6”,10,9,8,7

name :=	part name
desc :=	optional part description
mfr :=	optional manufacturer name
scmsym :=	the name of the schematic symbol
scmsympins:=	optional, the number of schematic symbol pins
footprint :=	the name of the pcb footprint
num_pins :=	the count of the number of pins. If the footprint pin count <0 meaning that it searches the current libraries for the given footprint name to retrieve the pin count.
pin_num_list :=	optional comma-separated list of pin numbers, this can be a numeric or alphanumeric list.

**PART**,name,desc,mfr,footprint,num\_pins[,pin\_num\_list]

Generate a new part using the supplied parameters, without adding any gates to the part.

name :=	part name
desc :=	optional part description
mfr :=	optional manufacturer name
footprint :=	the name of the pcb footprint
num_pins :=	the count of the number of pins. If the footprint pin count <0 meaning that it searches the current libraries for the given footprint name to retrieve the pin count.
pin_num_list :=	optional comma-separated list of pin numbers, this can be a numeric or alphanumeric list.

### Other commands

**ADDATTR**,name,value

Add an attribute to the previously generated part. This command must come after a **NEWPART**, **FINDPART** or **ADDPART** command so that a ‘current part’ is available to which the attribute can be added.

The following ‘special’ attribute names are recognised and will be added to the part as the equivalent built-in attributes:

- 3DPACKAGE
- FAMILY
- HEIGHT
- HYPERLINK
- SPICEDEVICE
- SPICEVALUE
- SPICETEMPLATE
- SPICEFUNCTION

SPICEPARAMETERS  
 SPICEDEFINITION  
 SPICETOLERANCE

Use ADDATTR,FAMILY,name to define the Part Family name on the Part.  
 Use ADDATTR,description,description\_here to overwrite the Description field added to a Part.

Use ADDATTR,Mfr,manufacturer\_name to overwrite the Mfr field added to a Part.

When using HYPERLINK,value this will replace the built-in <Hyperlink> attribute field. You can also specify it in brackets < > to replace the attribute value. This also applies to the built-in attribute <Component Height> attribute and HEIGHT.

ADDGATE,scmsym,num\_pins[,pin\_num\_list]

Add a gate to the current part.

If specifying pin number entries for 'multiply mapped' pins, the entry should be enclosed in double-quotes, for example: 1,2,3,"4,5,6",10,9,8,7

scmsym := the name of the schematic symbol  
 num\_pins := the count of the number of pins on the symbol  
 pin\_num\_list := optional comma-separated list of pin numbers

ADDPART,name

Generate another part using the given part name, copying all remaining parameters from the previously generated part. This command must come after a NEWPART or ADDPART command so that a 'current part' is available for the part details.

ADDPARTREP,partrep\_name[,scmsym,num\_pins[,pin\_num\_list]]

Add a part representation and (optionally) its first gate to the current part. Leave the partrep\_name blank to get the current part representation name as defined by the PARTREP command. If not blank, this will update the value of the current part representation name.

If specifying pin number entries for 'multiply mapped' pins, the entry should be enclosed in double-quotes, for example: 1,2,3,"4,5,6",10,9,8,7

partrep\_name := the name of the part representation  
 scmsym := the name of the schematic symbol  
 num\_pins := the count of the number of pins on the symbol  
 pin\_num\_list := optional comma-separated list of pin numbers

ADDPINATTR, pin\_name, pin\_attr=attr\_value [ , pin\_attr=attr\_value ... ]

Add an attribute or property to a part pin.

pin\_name := identifies the pin number to which attribute applies. If this is \* then attribute is applied to all

pins that don't have any attributes, logic name or pintype.  
pin\_attr := pin attribute or property name. Pre-defined names are: LOGICNAME, NETNAME, PINTYPE (see below) and PINSWAP. Other names are assumed to be user-defined attributes to be added to the pin. Note: SWAPGROUP has been superseded by the PINSWAP command but is still supported in existing Library Toolkit files.  
attr\_value := attribute or property value

For PINTYPE, the values for attr\_value are:

UNDEFINED  
OUTPUT  
INPUT  
BI-DIRECTIONAL  
OPEN COLLECTOR  
OR-TIEABLE  
TRI-STATE  
TERMINATOR  
POWER  
GROUND  
OPEN EMITTER  
NO CONNECT  
SOURCE  
LOAD  
PASSIVE  
PCB CONNECT

ADDUNGATEDPINS, pin\_type, net, pin\_name [ , pin\_name ... ]

Add one or more ungated power/ground pins to a part.

pin\_type := see list of pintypes under ADDPINATTR  
net\_name := name of the net to apply to the pins  
pin\_name := identifies the pin to add

ALLOWADDPINS, bool

Specifies whether the ADDPINATTR command should add new (ungated) pins for any pin names specified that don't already exist on the part. Default value is True.

AUTONAME,separator,stem,attr\_name[,attr\_name...]

Define the rules for auto-naming parts based on their attribute values.

separator := text to separate each part of name  
stem := text to place at start of each name  
attr\_name := name of attribute holding value to add to name

To stop autonaming (i.e. to revert to 'manually' named parts), include an AUTONAME command with NONE as the only parameter, like this:

AUTONAME,NONE

AUTOPART,attr\_name=attr\_value [ , attr\_name=attr\_value ]

Create an auto-named part (using the name rules specified by the preceding AUTONAME command), adding the given attributes to the part as it is created.

CONNECTOR, bool [ , sym\_name ]

Specifies whether parts created using PART command are connector parts. If True, sym\_name should be included to specify the name of the appropriate schematic symbol. Default value is False.

COPYPART, name, newname [ , description [ , attr\_name = attr\_value ... ]

Creates a copy of an existing part to a new name.

name := name of existing part

newname := name of new part

description := part description (optional)

attr\_name = attr\_value := one or more pairs of attribute settings

DELATTR, attr\_name

Deletes the named attribute from the current part (as located using the FINDPART command).

GATESWAP, [partrep], swap\_group , gate\_name

partrep := Part Representation name (optional)

swap\_group := letter or number to represent the swap group

gate\_name := the Gate letter to add the swap group to

Use this command after each gate. It uses the Gate letter to identify the gate, not the symbol name.

MAKEGROUP,name [ , name ... ]

Groups all the named parts together into a single part group. If you name a part that is already in a group, then all parts listed for this command will be added to that group. Parts with different pincounts will not be added to the group, and neither will parts that already belong to a second group if you first name a part that is already in a different group.

name := name of existing part

NAMESTEM,name

Sets the default component name stem to be used when adding parts.

PARTGROUP,group\_name

Sets the name of the group to which parts will belong. This name will be used for all subsequent parts that are added using any of the commands that create parts. To reset to the default behaviour (each part in its own group), use NONE for group\_name.

PARTREP,rep\_name

Sets the name of the current Part Representation. As new parts are created they will have this name applied to their first representation.

Also sets the 'context' in which other part commands operate when manipulating existing parts found using the FINDPART command. When an existing part is identified using FINDPART, various commands such as ADDGATE will operate on the named part representation.

To reset to the default behaviour (no specified part representation), use NONE for the rep\_name. Then all commands will operate on the default (or only) part representation.

RENAMEPART, oldname [ , oldname ... ] , newname

IMPORTANT: this command acts directly on the currently selected library.

Also, as this command can remove parts from your library without asking for confirmation, it is recommended that you take a backup copy of your library first just in case the results are not what you expect.

Renames the specified existing part(s) to a new part name. If the new part name already exists (as it will always do if you supply more than one oldname in the command), the list of footprints on the old part will be added to the list of footprints on the new part, and the old part will be deleted. This will therefore act as a 'merge' command.

You can also use wildcards in the oldname fields, for example:

RENAMEPART, 1466\*, AMX-1466

will end up with a single part called AMX-1466 that is the same as the first 1466\* part found in the library, but with the footprints of the following 1466\* parts added to its footprint list.

oldname := existing part name

newname := new part name

RENAMEPARTMATCHATTRIBUTE, attrname

This command is used when applying a PGF file containing RENAMEPART commands to a Design confirmation, and is used to alter the value of the stated attribute at the same time as altering the part name.

This can be used for example if you have an attribute that contains the part number (perhaps for the Pulsonix Database Connection) that has to have a value that is the same as the partname. As a part is found and renamed by the RENAMEPART command, the specified attribute will have its value changed to match.

SETDESCRIPTION, name, string

Sets the description of the specified part to the given string.

name := part name

SETFOOTPRINT, name, footprint\_name [ , footprint\_name ... ]

Replaces the list of footprints referenced by the specified part. Any existing footprint names on the part will be removed.

name := part name

footprint\_name ::= name of pcb footprint

SETGATE, name, gate\_name, pin\_name, logic\_name [ , pin\_name, logic\_name ... ]

Replaces the contents of the specified gate on an existing part. The pin name and logic name pairs are applied in schematic symbol pin order, i.e. the first pair apply to symbol pin 1, the second pair to pin 2, etc.

name := part name

gate\_name ::= name of gate (e.g. A, B, C)

pin\_name ::= pin name to apply to gate pin

logic\_name ::= logic name to apply to gate pin

SETGATEPINS, name, ...

Same as SETGATE but doesn't remove existing pin details.

SETGATESYMBOLS, name, part\_rep\_name, gate\_name, sym\_name [, gate\_name...]

Replaces the symbol(s) used by the specified part.

name :=	part name
part_rep_name :=	name of part representation
gate_name :=	name of gate (e.g. A, B, C)
sym_name :=	symbol name

SETSTEM, [name,] string

Changes the default component name stem of the specified part (or if name not supplied then the current part as found by FINDPART) to the given string. This command can be applied to normal or connector parts.

name :=	part name
string :=	stem letter(s) to be used, U, R, C, PL, IC etc.

SETSYMBOL, [name,] sym\_name

Changes the symbol used by the specified part (or if name not supplied then the current part as found by FINDPART) to the given symbol. This command can be applied to normal or connector parts.

name :=	part name
sym_name :=	symbol name

++

When this command is added to the end of a line, the line is "joined" to the following line to form a single command. This allows very long commands to be split across multiple lines in the input file to make it easier to read. See the Part section of the Appendix A for an example of how to use this command.

## Appendix A. Sample Files

### Symbol Files

FORMAT,SGF,1	
TYPE,RECT	Rectangular type
UNITS,1,1,2	
LINESTYLE,Normal,8	
PADSTYLE,Cross	Use a standard 'cross'
PADSHAPE,Cross,	for the terminals

; create a second part using characteristics from the first part
; but overwrite attributes using different values
ADDPART,LQW04AN1N8C00p
ADDATT,L,1.8nH
ADDATTR,RatedCurrent,700mA
ADDATTR,DCRes,0.06
ADDATTR,Freq,17.0GHz
```

## Adding Alphanumeric Pins to Parts

```
FORMAT,PGF,3
; create a new part with alphanumeric pin names
PART,NewAlpha,Alphanumeric Pins Example,ST,SOIC8,8,O1,I1,I2,P1,P2,++
O2,I21,I22
SETSTEM,U
; add two gates and name the pins using the alphanumeric pin names
ADDGATE,AMP,5,O1,P1,I1,I2,P2
ADDPINATTR,O1,PINTYPE=OUTPUT,LOGICNAME=OUT1
ADDGATE,AMP2,3,I21,I22,O2
ADDPINATTR,O2,PINTYPE=OUTPUT,LOGICNAME=OUT2
```

## Appendix B. Change History

### Issue 06-Apr-22 [Pulsonix 11.0]

Added ability in NEWPART and PART commands to footprint pads so if the num\_pins := count < 0 it searches the current libraries for the given footprint name to retrieve the pin count.

### Issue 27-Apr-20 [Pulsonix 10.5]

Missing comma in example ADDGATE command.

### Issue 22-Feb-18 [Pulsonix 10.0]

Adding information for some previously undocumented commands in Symbol files.

### Issue 27-Aug-14 [Pulsonix 8.0]

Addition of the following commands for adding gate and pin swap information to gates; GATESWAP and PINSWAP.

Note: The existing SWAPGROUP will still function but has been replaced with PINSWAP.

### Issue 03-May-13 [Pulsonix 8.0]

SETGATESYMBOLS command was missing the part representation name from the list of parameters.

### Issue 03-Sept-12 [Pulsonix 7.5]

Clarification of some commands within the Part files section.

Description of existing EXIT command added.

### Issue 20-Oct-10 [Pulsonix 6.1]

Addition of RENAMEPART and RENAMEPARTMATCHATTR commands for PGF files, allowing part rename operations on designs and libraries.

### Issue 30-Apr-09 [Pulsonix 6.0]

Show how to add comments to the file using # as the first character on the line.

Correction to the NEWPART command on a part, to show the missing optional field for the number of Symbol pins.

Handling of multiply-mapped pins in NEWPART, ADDGATE and ADDPARTREP commands.

Change of default handling for part grouping for format 3 part files, see page 21.

Addition of the following commands:

ASSOCPART : create a new Associated Part.

COPYPART : make a copy of an existing part under a new name.

MAKEGROUP : collect existing parts together into a part group.

PARTGROUP : collect new parts together into a part group.

SETGATESYMBOLS : set the list of symbol names to apply to a gate.

### **Issue 20-Oct-08 [Pulsonix 5.1]**

New SETGATESYMBOLS command on a part, allowing the addition of alternate symbol names to an existing gate definition.

### **Issue 08-May-08 [Pulsonix 5.0]**

ADDATTR command on a part can now add 'built-in' attributes such as Family, Height and Hyperlink.

PADSHAPE commands now recognise a larger range of available pad shapes.

### **Issue 27-Mar-08**

SETFOOTPRINT command can now accept multiple footprint names, to specify a list of alternate footprints for a part. First footprint name is used as the default footprint for the part.

### **Issue 18-Feb-04**

Changes added for Pulsonix version 3.0.

Additional commands for generating new parts: ADDUNGATEDPINS, ALLOWADDPINS, CONNECTOR,

Additional commands for amending existing parts: DELATTR, SETDESCRIPTION, SETFOOTPRINT, SETGATE, SETSTEM, SETSYMBOL.

Part command line continuation suffix "++"

### **Issue 01-Sep-03**

Changes for handling symbol integration files, added for Pulsonix version 2.1.

### **Issue 02-June-03**

Addition of command for finding Parts (FINDPART)

### **Issue 26-Feb-03**

Addition of commands for bond pads and wires (ADDBONDPAD, ADDBONDPADSET, BONDPADDRILL, BONDPADLAYER, BONDPADLENGTH,

BONDPADSHAPE, BONDPADSIZE, BONDPADSTYLE, WIRELAYER, WIRESIZE, WIRESTYLE).

Addition of command ADDPADSET for adding multiple 'arrays' of pads in specific positions.

### **Issue 09-Sep-02**

Addition of PART and ADDGATE commands to facilitate multi-gate parts.

### **Issue 21-Aug-02**

Addition of command ADDPINATTR for part pin attributes and properties.

Addition of command PARTGROUP for grouping parts.

Addition of commands AUTONAME and AUTOPART for creating auto-named parts.

Addition of command PLACEBOX for user-defined placement shape in footprint.

Changes to sample listings for above commands.

### **Issue 06-Aug-02**

Values shown for PADLAYER changed from <All>, <Top>, <Bottom> to <Through Board>, <Top Side> and <Bottom Side> respectively.

Note that ADDPAD command over-rides default pad pattern for footprint.

Addition of sample footprint commands for use of ADDPAD command.

Change to ADDPART command to match actual program behaviour. Copies details from previously added part, does not add to same part group.
